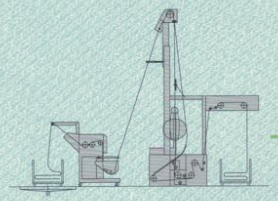
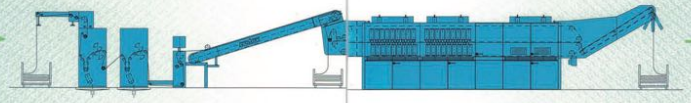
SANTEX System Engineering for the treatment of open-width fabrics: the universal solution for the finishing process.

SANTEX is the partner of the finishing industry during the preplanning, projecting, manufacturing, erection and starting-up stage of complete production lines and, in addition to the hardware, also supplies software in the form of technology and application advice.



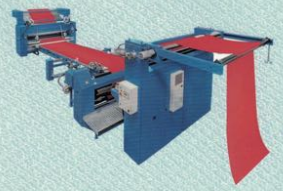
The requirements of the goods to be finished, as well as the demands for universality and the multiple use of a plant, call for suitable accessories and special equipment.



- **SANTASHRINK-PROGRESS** for tensionless drying, shrinking and relaxation of knitted fabrics in open width. In an extended design with single/double padder and pin-frame entry for width stretching and wet-compacting as preparation of the fabrics prior to drying, with reproducible, unequalled quality gains.

This machine combination also permits the unlimited treatment of tubular knitted fabrics. A universal concept for the finishing of knits made of cotton and cotton blends.

To achieve good finishing results, every individual form of loop structure of knitted fabrics, as well as the further processing of the respective quality, necessitates the lining up of optimized production stages, consistent observation of details as well as interacting process sequences.



- **SANTACOMPACT** for continuous levelling, steaming, smoothing and compacting of open-width knitted fabrics. With suitable accessories, the most diverse finishing requirements can be fulfilled.
